

Assignment 3

1. Create the tree

class Node:

def __init__(self, value):

self.value = value

self.children = []

2. Display the tree structure

def display_tree(node, level=0):

print('\t' * level + str(node.value))

for child in node.children:

display_tree(child, level + 1)

3. Perform breadth-first traversal

def breadth_first_traversal(root):

queue = [root]

while queue:

node = queue.pop(0)

print(node.value, end=' ')

queue.extend(node.children)

print()

4. Search for a node using breadth-first search

def bfs_search(root, target):

queue = [root]

visited = []

found = False

while queue:

node = queue.pop(0)

visited.append(node.value)

if node.value == target:

print(f"Found {target}: Traversal order {visited}")

found = True

break

```
    queue.extend(node.children)
if not found:
    print(f"Nodes visited: {visited}")
    print(f"{target} NOT FOUND")
```

1. Build the tree

```
root = Node(1)
root.children = [Node(2), Node(5), Node(6)]
```

```
node2 = root.children[0]
node2.children = [Node(3), Node(4)]
```

```
node6 = root.children[2]
node6.children = [Node(7), Node(8), Node(12)]
```

```
node8 = node6.children[1]
node8.children = [Node(9), Node(10), Node(11)]
```

2. Display the tree structure

```
print("Tree Structure:")
display_tree(root)
```

3. Perform breadth-first traversal

```
print("\nBreadth First Traversal:")
breadth_first_traversal(root)
```

4. Search for nodes 8, 10, and 13

```
print("\nSearching for 8:")
bfs_search(root, 8)
```

```
print("\nSearching for 10:")
bfs_search(root, 10)
```

```
print("\nSearching for 13:")
bfs_search(root, 13)
```

Output:

Tree Structure:

```
1
  2
    3
    4
  5
  6
    7
    8
      9
      10
      11
    12
```

Breadth First Traversal:

1 2 5 6 3 4 7 8 12 9 10 11

Searching for 8:

Found 8: Traversal order [1, 2, 5, 6, 3, 4, 7, 8]

Searching for 10:

Found 10: Traversal order [1, 2, 5, 6, 3, 4, 7, 8, 12, 9, 10]

Searching for 13:

Nodes visited: [1, 2, 5, 6, 3, 4, 7, 8, 12, 9, 10, 11]

13 NOT FOUND
